

A mobile-first approach to endpoint security

As technology has come to dominate business processes, employees need constant access to data and applications to work effectively. Organisations also depend on real-time communication to facilitate collaboration and quick decision making to deliver an excellent customer experience. Flexible working, using mobile devices and cloud-enabled computing, allow both you and your employees to operate as a part of a team from different locations to help you achieve this outcome.

However, with a growing number of mobile devices supporting workforces, corporations are losing control over how their data is accessed. Devices can easily fall prey to cyber-attacks that are growing both in number and sophistication. This makes it imperative to invest in endpoint security solutions that are tailored to address this environment.

Trusted technology, secure devices

With Telstra's mobile-first endpoint security solutions, you can help to secure both business and employee-owned devices against cyberattacks on your mobile environment, including devices, networks and applications (DNA). Be assured we can help keep your data safe, and employees more productive, without compromising the user experience.

How it works

Proactive threat detection, safer mobile environment

Telstra's Endpoint Security solution offers:

- Early detection of threats
- Timely remediation
- Greater visibility
- Easy management

The solution is designed to protect against key threat vectors affecting your mobile environments including apps, devices and networks. Our endpoint security solutions may use any combination of techniques to detect threats across vectors, including machine learning, crowdsourced threat intelligence and behavioural anomaly detection to trigger alerts. These techniques are necessary to respond to the rapidly evolving and increasing threats affecting mobile environments.

Benefits

Prevention of threats

Prevent attacks by detecting looming threats instead of having a reactive approach to security breaches.

Increased productivity

Increase employee productivity by providing secure mobile access to business information, enabling your workforce to make innovative and informed decisions.

Protect your Data

Help to keep your corporate and customer data secure and avoid consequences arising from unwanted exposure of this information.

Increased visibility

Gain near real-time visibility into malicious threats with detailed analyses of risky apps and other mobile threats that target your devices.

Advanced technology

Our machine learning algorithms support mobile defence strategy by providing intelligence on threats, with or without Internet connectivity.

Why Telstra

Telstra is a fully integrated mobility managed service provider that brings together devices, plans, security, endpoint lifecycle management, professional and managed services on Australia's best mobile network. Working with Telstra offers you a range of possibilities and options.

Access to trusted expertise

Work with Telstra's team of more than 500 skilled data scientists, DevOps, business and security analysts to help secure your business.

Benefit from the best of global technology

Telstra partners with leading security providers to make sure your business gets the best the industry has to offer.

To truly mobilise and help secure your business, contact your Telstra Client Executive.
